OVERVIEW

The short version

Wax London showed hanger shots as the first image on suiting category pages. Most fashion sites do the same. We thought suits were different. Fit, shoulder line, and how the cloth hangs are hard to judge from a flat photo. Seeing the jacket on a person might help.

So we ran an A/B test on six suiting collections. Convert called it Model vs Product Image on suiting category pages. Variation 1 turned on Wax London's Model view toggle. The first tile image became a model shot. Copy, layout, and everything else stayed the same. One change: the photo. The test ran for 29 days, from 17 April to 15 May 2026. 14,115 people saw it, split 50/50.

HYPOTHESIS

Why we ran this test

We wanted a straight answer. On suiting pages, does a model photo as the first image beat a product-only photo?

If we show a model wearing the suit as the first image, more people will look and buy, because they can see the fit and how it looks on a body.

A t-shirt is easy to guess. A suit is not. You cannot tell from a hanger how a jacket sits on the shoulders, or how the trousers break at the ankle.

Pages in this test: suits, blazers, tailored trousers, linen suits, single-breasted suits, and double-breasted suits on waxlondon.com.

TEST SETUP

What we changed

Two versions. Same six pages. Traffic split evenly. The only change was the first image on the product tile, using Wax London's Model view toggle. Off for control. On for the variation.

CONTROL · MODEL VIEW OFF

Hanger photos as the first tile image · 6,994 visitors

RESULTS

What happened

After 29 days and 14,115 visitors, Variation 1 made more money per visitor, converted more, and put more items in the basket. People did not click more tiles on the listing. The gain showed up later: more checkouts, more items, more revenue.

METRIC	ORIGINAL	VARIATION 1	DIFFERENCE
Revenue per visitor	\$10.56	\$15.87	+50.28%
Total revenue	\$73,847	\$112,992	+\$39,145
Purchase rate	3.36%	3.97%	+18.28%
Average order value	\$315.59	\$390.98	+23.89%
Products per visitor	0.08	0.12	+54.44%
Products per order	2.33	2.97	+27.32%
Add to cart	4.82%	5.20%	+7.83%
Begin checkout	1.99%	2.42%	+21.53%

Metric	Original	Variation 1	Difference
Category tile clicks	43.22%	42.93%	-0.68%
Product page views	49.76%	48.81%	-1.9%
Bounce rate	88.69%	88.20%	-0.55%

Revenue per visitor reached 98.18% confidence. Products per visitor reached 99.29%. Purchase rate was 92.55%. Listing clicks were flat. These figures come from Convert's main Purchase goal.

Engagement

How far people scrolled

On the product page, Variation 1 visitors went further down the page at every checkpoint. Reaching 100% scroll was up 22.49%, at 99.09% confidence.

Depth	Original	Variation 1	Lift
25% down	23.79%	24.53%	+3.12%
50% down	15.46%	16.07%	+3.94%
75% down	9.72%	10.36%	+6.59%
100% down	4.92%	6.02%	+22.49%

Insights

What I take from this

Seeing the fit helped people buy

Purchase rate went from 3.36% to 3.97%. Revenue per visitor went from \$10.56 to \$15.87. A model shot shows shape and styling in a way a hanger cannot.

Baskets got bigger

Average order value went from \$315.59 to \$390.98. Items per order went from 2.33 to 2.97. That looks like people building an outfit, not grabbing one piece.

We did not win with more listing clicks

Tile clicks were flat. Product page views were slightly down. The extra money came from what people did after they arrived: more checkout, more items, more spend.

Bounce rate did not get worse

Bounce went from 88.69% to 88.20%. That is basically unchanged. An early snapshot made bounce look like a risk. The finished data does not.

CAVEATS

What this does not prove

- 01 **Purchase rate is not at 95% confidence.** Convert gives purchase rate 92.55%, revenue per visitor 98.18%, and products per visitor 99.29%. The money story lines up, but 235 vs 283 purchases is still the noisier number.
- 02 **This is suiting only.** 14,115 visitors is a fair sample for this category. It does not mean the same photo swap will work on t-shirts, knitwear, or belts.
- 03 **It ran in spring.** 17 April to 15 May 2026 sits in suiting and linen season. Do not scale the \$39,145 gap to a full year. The percentage lifts are the part that should travel.
- 04 **Convert had two purchase goals.** The main Purchase goal shows revenue per visitor up 50.28%. A manual purchase goal shows a smaller lift, 19.45% at 81.49% confidence. Both favour Variation 1. This write-up uses the main goal.

NEXT STEPS

Turn model photos on for suiting pages

The test is done. Revenue per visitor, products per visitor, and full-page product scroll all cleared 95% confidence for Variation 1. Listing clicks did not need to rise for revenue to rise.

Do this now

Roll out Variation 1 on the six tested suiting collections. Watch revenue per visitor and order value in your live analytics for a few weeks after launch.

Test this next

Try model-first tiles on shirts and formal extras. Keep the photo as the only change. Do not assume you need more listing clicks to make it worth doing.
